

# MS or PhD Assistantship in mosquito ecology School of Biological Sciences, Illinois State University

I am recruiting one new graduate student for research on density dependence and population dynamics of mosquitoes. The overall project, funded by NIH, concerns the ecology of interactions of density dependent regulation of populations of larvae and extrinsic sources of mortality such as predation or efforts at mosquito control. Planned projects involve both field and laboratory experiments with multiple species of medically important mosquitoes. Research assistantship funding is available, as is teaching assistantship support for qualified students. For details contact:

Steven Juliano  
Professor of Ecology
