

# Reporting Statistics in APA Style

Dr. Jeffrey Kahn, Illinois State University

The following examples illustrate how to report statistics in the text of a research report. You will note that significance levels in this resource are reported as either " $p > .05$ ," " $p < .05$ ," " $p < .01$ ," or " $p < .001$ ." It is permissible to report the precise p-value, but that is not the option used in this particular resource.

Please pay attention to issues of italics and spacing. APA style is very precise about these.

---

**Mean and Standard Deviation** are most clearly presented in parentheses:

The sample as a whole was relatively young ( $M = 19.22$ ,  $SD = 3.45$ ).

The average age of students was 19.22 years ( $SD = 3.45$ ).

**Percentages** are also most clearly displayed in parentheses with no decimal places:

Nearly half (49%) of the sample was married.

**Chi-Square** statistics are reported with degrees of freedom and sample size in parentheses, the Pearson chi-square value (rounded to two decimal places), and the significance level:

The percentage of participants that were married did not differ by gender,  $\chi^2(1, N = 90) = 0.89, p > .05$ .

**T Tests** are reported like chi-squares, but only the degrees of freedom are in parentheses. Following that, report the  $t$  statistic (rounded to two decimal places) and the significance level.

There was a significant effect for gender,  $t(54) = 5.43, p < .001$ , with men receiving higher scores than women.

**ANOVAs** (both one-way and two-way) are reported like the  $t$  test, but there are two degrees-of-freedom numbers to report. First report the between-groups degrees of freedom, then report the within-groups degrees of freedom (separated by a comma). After that report the  $F$  statistic (rounded off to two decimal places) and the significance level.

There was a significant main effect for treatment,  $F(1, 145) = 5.43, p < .01$ , and a significant interaction,  $F(2, 145) = 3.13, p < .05$ .

**Correlations** are reported with the degrees of freedom (which is  $N-2$ ) in parentheses and the significance level:

The two variables were strongly correlated,  $r(55) = .49, p < .01$ .

**Regression** results are often best presented in a table. APA doesn't say much about how to report regression results in the text, but if you would like to report the regression in the text of your Results section, you should at

least present the standardized slope (beta) along with the t-test and the corresponding significance level. (Degrees of freedom for the t-test is  $N-k-1$  where k equals the number of predictor variables.) It is also customary to report the percentage of variance explained along with the corresponding F test.

Social support significantly predicted depression scores,  $\beta = -.34$ ,  $t(225) = 6.53$ ,  $p < .01$ . Social support also explained a significant proportion of variance in depression scores,  $R^2 = .12$ ,  $F(1, 225) = 42.64$ ,  $p < .01$ .

**Tables** are useful if you find that a paragraph has almost as many numbers as words. If you do use a table, do not also report the same information in the text. It's either one or the other.
